Even the best pilots have physical & mental limits

► how could an ALIAS assistant extend these? ◀

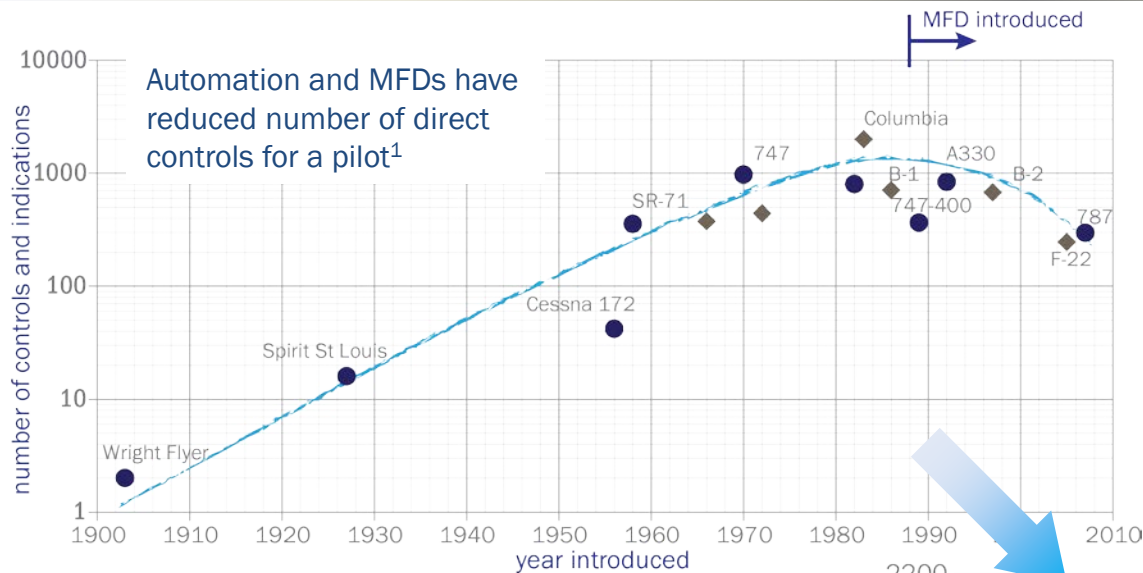

ALIAS introduction

“The objective of the ALIAS program is to develop and insert new automation into existing aircraft to enable operation with reduced onboard crew”

Dangerous trends in aircraft complexity and automation

procedural complexity pushing past limits of human capacity

part-time automation is creating a crisis in the cockpit²

ALIAS could provide a full-time hierarchical abstraction to manage cockpit workload

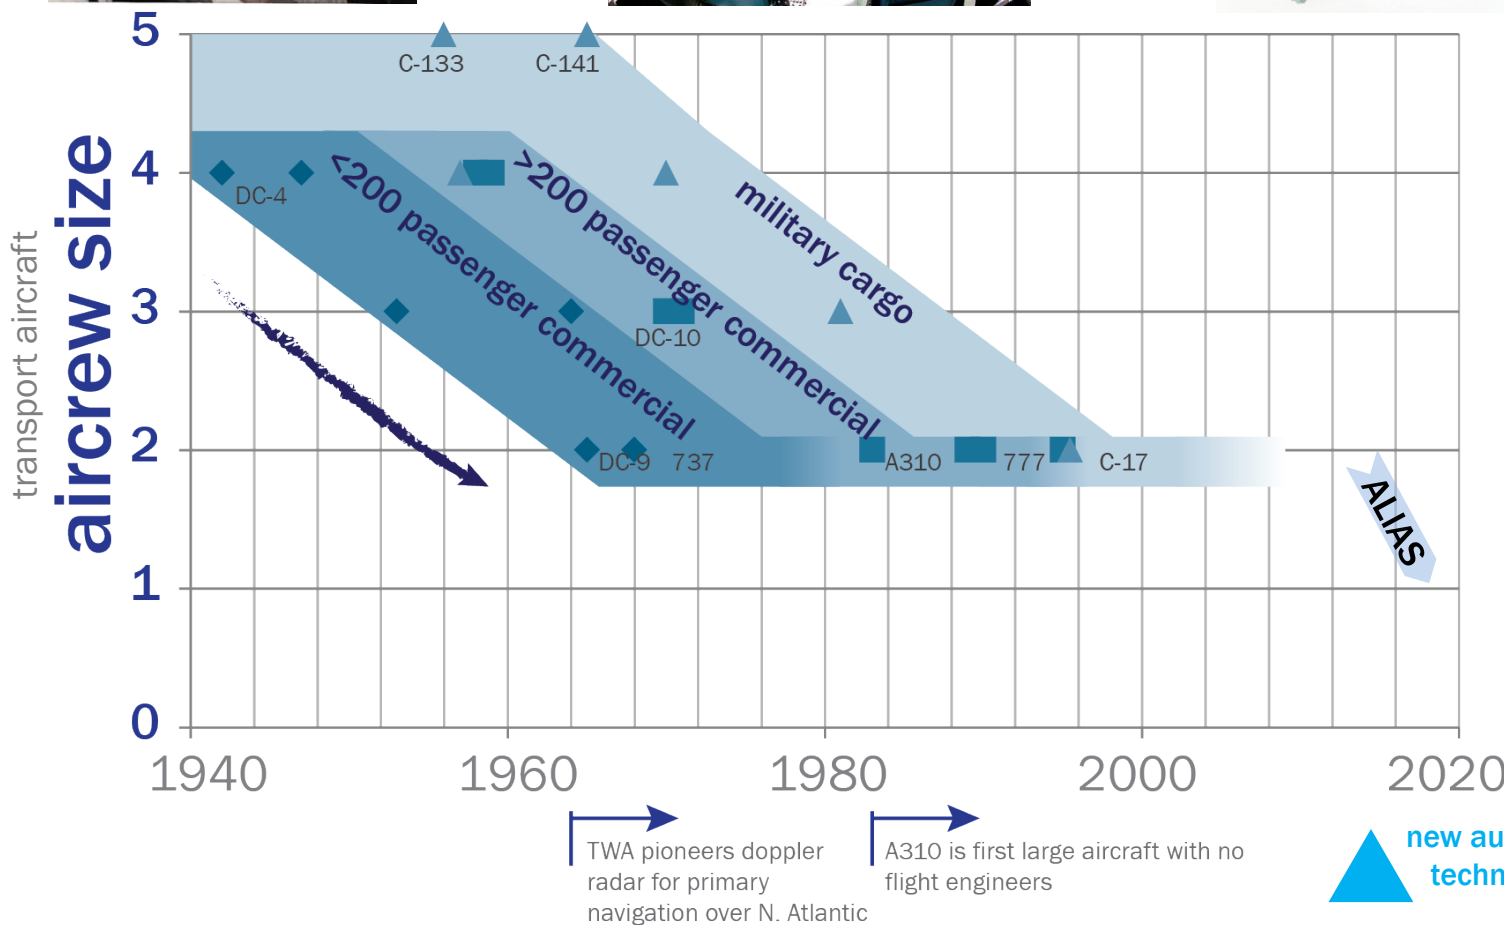

Downward trend in transport operating aircrew

Theoretic advantages of increased automation in aircraft

- Better abilities for *some* operations
- Reduced pilot workload
- New capabilities and missions

challenges to further reducing onboard aircrew:
safety, trust, cost

ALIAS would provide a path to addressing challenges of safety, trust, and cost

What is ALIAS?

ALIAS would be an automation kit; a toolbox

that enables operation with *variable onboard crew* on a variety of existing aircraft

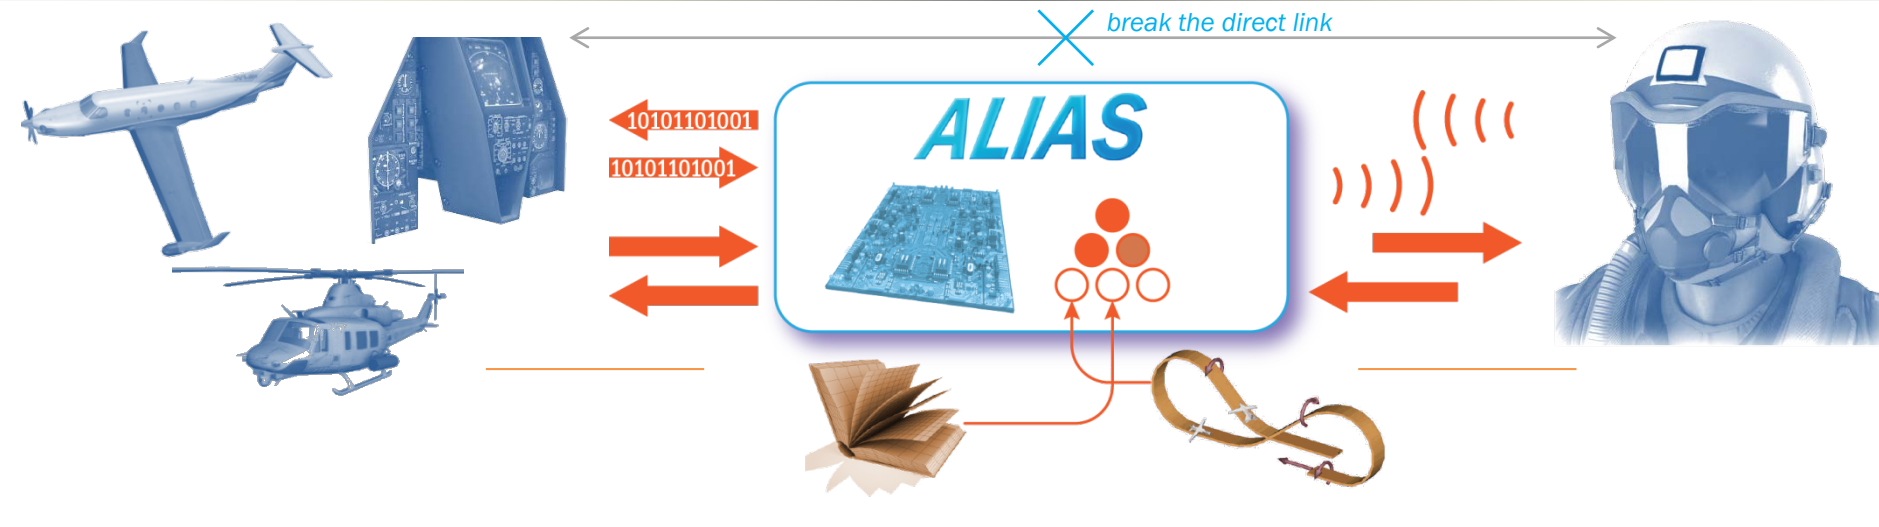

installed in a *portable, reversible* manner

controlled at a “mission commander” level from a latency tolerant, low-workload user interface

Technology framework: three key technical thrusts

(1) ALIAS-aircraft interface

[aircrew motor functions]

- Operation and automation of aircraft functions without extensive aircraft modifications

metrics

- installation time of 1 day
- automatic flight operability from takeoff-to-landing flight via installable in-cockpit system

(2) Knowledge acquisition

[aircrew training]

- Adaptable core flight controller and machine-assisted assimilation of procedural knowledge

metrics

- time-to-adapt in <1 month

(3) Human-machine interface

[capture & inform operator intent]

- High-level mission direction
- Condensed display of expert system logic and system status

metrics

- control of flight via a single-screen and/or voice

Current Platforms

ALIAS extensibility to future applications

- ALIAS could provide a simpler way to interface with complex machines
- ALIAS could provide low cost means to bridge between automation and autonomy in field of aerospace, burdened with high capital costs
- Defies current platform-centric model for advances
